Battery Solutions West Coast Expansion

[Battery Solutions](#), North America's leader in battery collecting, sorting and recycling is relocating and expanding its west coast facility in Mesa, Arizona. The move represents a significant milestone and further underscores Battery Solutions commitment to the west coast market. Market growth, new customer acquisition and market share gain all contribute to higher recycling volumes the company is realizing. The new facility provides improved capacity and a resource to support its growing west coast customer base.

"We have needed to expand our west coast operations for some time now, with this investment we have an excellent platform to support our anticipated growth," said Thomas Bjarnemark, CEO of Battery Solutions. "Increased battery volumes prove people are actively recycling their batteries opposed to landfilling them and ensuring we have cutting edge facilities to handle these volumes encourages future growth."

The facility more than doubles the current footprint. Combining the expansion with significant investments in new equipment and improved technologies serves to further cultivate Battery Solutions development. April 2016 publically demonstrated the company's evolution with the launch of its new brand and new website to better serve customers and align its values with the circular economy, believing that as society we need a "take, make, reuse" approach for sustainable living.

Battery Solutions is continuously investing in new and innovative practices and technologies to stay at the forefront of the rapidly transforming energy storage industry to offer environmentally and economically sustainable solutions.

Battery Solutions new location is at 618 E. Auto Center Drive, Suite 111, Mesa, AZ 85204.

About Battery Solutions, LLC

Battery Solutions offers end-to-end lifecycle management and customized recycling solutions for all battery chemistries throughout North America. We offer customized battery recycling solutions to address the diverse needs of our customers, which include environmental and regulatory compliance, documentation, safety, logistics, reporting and the conversion of waste into the highest economic value.
