Subject : Revision on Inspection Method of Waste Paper

Dear all,

Following up on findings of discrepancies in the importation of waste paper by Indonesian Customs at the port of arrival of Tanjung Emas – Semarang and Tanjung Perak – Surabaya, and while awaiting the issuance of waste paper inspection technical guidelines by the Ministry of Trade, we hereby convey that inspection methods currently applied for waste paper inspection namely 10% stuffing supervision was declared invalid.

The verification of waste paper import will be returned to its original rules, namely by 100% stuffing supervision. This provision is the same as the verification rules for the import of other types of non-hazardous waste (steel scrap, plastic, etc).

In addition to ensuring that the waste paper being examined is not contaminated with hazardous or toxic waste (B3) and not contain excessive impurities, random items must be opened at least 2% (two percent) from the total shipment bales. The maximum impurity limit is 0.5%.

The enactment of this change in inspection conditions applies to the inspection as of April 1st, 2019, and everything will be adjusted after the issuance of waste paper inspection technical guidelines by the Ministry of Trade.

Thus we convey this notice to be carried out strictly and orderly.

Sincerely yours,

Andre Esfandiari

Head of KSO Sucofindo – Surveyor Indonesia
